uper Mario	Wii	2009.0	Platform	Nintendo	14.44	6.94	4.70	2.24	28.32	87.0	80.0	8.4	594.0

Dataset contains 15 rows, 5 of which contain categorical data, namely Genre, Platform, Developer, Name and Publisher. The other 10 columns have numeric data, sales in 5 regions, user score, critic score, user count, critic count, and year of release. It contains 16 thousand rows, however there are a number on missing values and values which cause bias which has been cleaned before beginning analysis.

Data Cleaning

- We have cleaned the data quite thoroughly before beginning our analysis.
- We employed the cleaning methods : mean substitution and last observation carried forward.
- We also employed an additional method of dropping rows where 5 columns had missing data/ no sales as comparison would lead to bias when no sales occur in that region.

In [5]: data1

Name	Platform	Year_of_Release	Genre	Publisher	NA_Sales	EU_Sales	JP_Sales	Other_Sales	Global_Sales	Critic_Score	Critic_Count	User_Score	User_Count
Wii Sports	Wii	2006.0	Sports	Nintendo	41.360000	28.96	3.770000	8.4500	82.53	76.0000	51.00000	8.000000	322.00

New Super Mario Bros. Wii	Wii	2009.0	Platform	Nintendo	14.440000	6.94	4.700000	2.2400	28.32	87.0000	80.00000	8.400000	594.00
Mario Kart DS	DS	2005.0	Racing	Nintendo	9.710000	7.47	4.130000	1.9000	23.21	91.0000	64.00000	8.600000	464.00
Wii Fit	Wii	2007.0	Sports	Nintendo	8.920000	8.03	3.600000	2.1500	22.70	80.0000	63.00000	7.700000	146.00

Comparison of sales per genre in different parts of the world

Average Japanese sales of games for each genre

Average Global sales of games for each genre

Average North American sales of games for each genre

Average sales in the rest of the world of games for each genre

Average European sales of games for each genre

Percentage of sales per genre in different parts of the world

Rest of world Games Sales Split Up

Japanese Games Sales Split Up

Global Games Sales Split Up

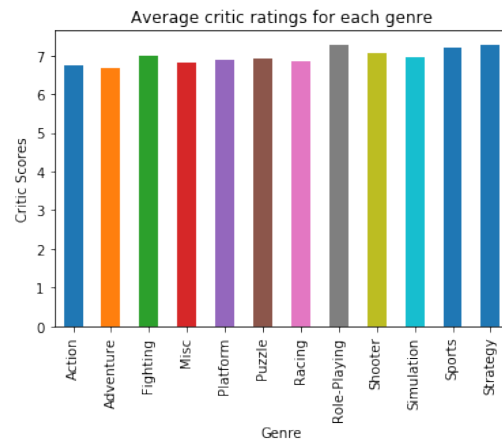

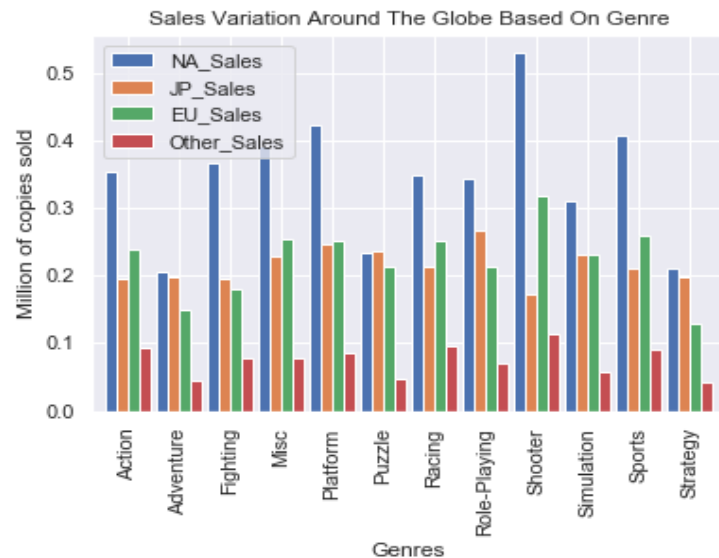

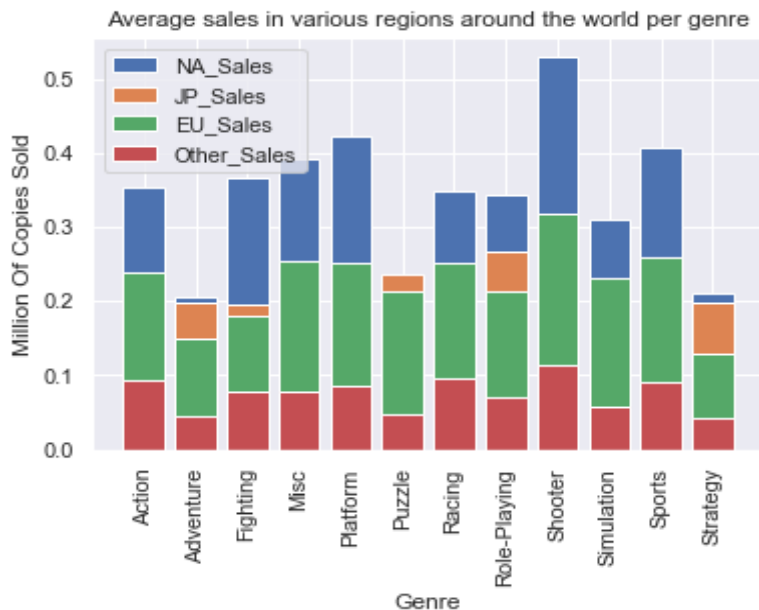

European Games Sales Split Up

American Games Sales Split Up

Some more comparisons

Boxplots:

Histogram

Hypothesis Testing

We made a hypothesis that the user scores on PS4 for strategy are more than 7.328255605278789 (the average score).

Thus our null hypothesis was $H_0: \mu \leq 7.328255605278789$.

The result after testing was that we “failed to reject null hypothesis”.

This implies that :

```
H0 :  $\mu \leq 7.328255605278789$ 
```

```
H1 :  $\mu > 7.328255605278789$ 
```

```
alpha value is : 0.05
```

```
actual z value : 1.6448536269514729
```

```
hypothesis z value : 1.3008894356055924
```

```
Failed to reject NULL hypothesis
```
